Part of the Advances in Intelligent Systems and Computing book series (AISC, volume 738) Abstract. Diabetes has become a serious health concern. The development of highly evolved blood glucose measurement devices have led to tremendous improvements in glucose monitoring and diabetic management. Tracking and maintaining traceability between glucose measurements, insulin doses and carbohydrate ...

Cardiovascular disease is the major cause of morbidity and mortality associated with diabetes. There is increasing evidence that advanced glycation endproducts (AGEs) play a pivotal role in atherosclerosis, in particular in diabetes. AGE accumulation is a measure of cumulative metabolic and oxidative stress, and may so represent the "metabolic memory".

Chronic inflammation plays an important role in the development of diabetes and its late complications. Over nutrition, physical inactivity, stress, truncal obesity, dyslipidaemia, hypertension and smoking directly and indirectly activate the family of nuclear factor kappa B, the principal factor of inflammatory response. Hiperglycaemia and especially brittle diabetes affect not only metabolic ...

The prevalence of non-alcoholic fatty liver disease (NAFLD) has been increasing rapidly. It is nowadays recognized as the most frequent liver disease, affecting a quarter of global population and regularly coexisting with metabolic disorders such as type 2 diabetes, hypertension, obesity, and cardiovascular disease. In a more simplistic view, NAFLD could be defined as an increase in liver fat ...
