Multimedia servers store and manage multimedia objects and deliver data streams in real-time, in response to requests from users. Introduction The creation, storage and delivery of ubiquitous, high performance multimedia services present a formidable challenge to the underlying telecommunications and computing infrastructure.

An integrated storage platform for open systems should be able of meeting the requirements of deterministic applications, multimedia systems, and traditional best-effort applications. It should also provide a disk scheduling mechanism fitting all those types of applications. In this paper, we propose a three-level hierarchical disk scheduling scheme, which has three main components:

As multimedia become an integral part of collaborative systems, we must understand how to design such systems to support the user's rich set of existing interaction skills, rather than requiring people to adapt to arbitrary constraints of technology-driven designs. To understand how we can make effective use of video in remote collaboration, we compared a small team's interactions through a ...
